SimbirSoft

QA Engineer (Web / Mobile / API / Automation)

Key achievements:

- Refactored 1,200+ Android automated tests as part of several infrastructure changes, including test data generation, SDK migration, user balance preparation, and migration to Deep Links.
- Reduced full Android regression execution time by approximately 60-70%, from 3-4 hours to 50-90 minutes.
- Increased web regression automation coverage from ~80% to 95% within 2-3 months; after the direction was reorganized, handed the completed automated regression suite over to the responsible team.
- Optimized most Android UI scenarios using Intent interception, Deep Links, and controlled test states instead of real transitions to external applications.
- Joined a new fintech project within one month as part of a temporary replacement and maintained the existing QA flow without reducing release speed or quality.
- Regularly conducted technical interviews for QA candidates and participated in assessing their technical level.
- Reduced the time required for typical large-scale changes in test code by approximately 75%, from ~2 hours to ~30 minutes, using AI agents and reusable instructions.

Responsibilities:

- Functional, regression, integration, and acceptance testing of web and Android applications.
- REST/SOAP API testing, SQL, Kafka, and integration testing.
- Development and maintenance of backend and Android automated tests in Kotlin using an internal test framework and Custom DSL.
- Analysis of automated test failures, test maintenance and refactoring, and development of Java test stubs.
- Log analysis and defect investigation using Kibana.
- Working with Jenkins and test environments.
- Using AI agents and LLMs for codebase, log, and error analysis, large-scale changes, and test refactoring.

Tech stack: Kotlin, Java, SQL, REST API, SOAP, Kafka, Jenkins, Kubernetes (K8s), Linux, Swagger, Kibana, Git, Android Studio, AI Agents / LLM, Custom DSL.

RITM

QA Engineer (Web / Mobile / API)

Key achievements:

- Was the first QA Engineer in a four-person product team and established the basic testing process from scratch.
- Built a regression suite of ~100 test cases from scratch, covering key user and integration scenarios.
- Introduced Confluence and Zephyr Scale for knowledge management and test documentation.
- Introduced Charles Proxy for client-server communication diagnostics and JMeter for performance testing.
- Established collaboration between QA and the support team and created an internal product knowledge base.
- Tested around 5 external integrations with banking and security systems.
- Regularly conducted technical interviews for QA candidates and participated in assessing their technical level.

Responsibilities:

- Functional, regression, and integration testing of web and mobile applications.
- Requirements and technical specification analysis.
- REST API and integration testing.
- Working with MySQL, PostgreSQL, and Kafka.
- Test environment setup, Jenkins, and Docker.
- UI automation using Selenium and performance testing using JMeter.
- Communication with customers and the support team.

Tech stack: REST API, SQL, MySQL, PostgreSQL, Kafka, Docker, Jenkins, Selenium, JMeter, Charles Proxy, Confluence, Zephyr Scale.

Additional Information

About Me

QA Engineer with 6 years of commercial experience in testing web and mobile applications, APIs, and integration systems.

My primary focus is functional, regression, integration, and API testing, supported by a strong technical foundation in SQL, Kafka, REST/SOAP, logs, and CI.

I have commercial experience in Kotlin-based test automation, including backend and Android automated tests, an internal test framework, and Custom DSL. On a large fintech project, I participated in a major refactoring of more than 1,200 Android automated tests and optimization of the regression test run.

I have experience quickly onboarding onto new projects and regularly participating in technical QA interviews and candidate assessment.

In my daily work, I use AI agents and LLMs for codebase, log, and error analysis, large-scale changes, and automated test refactoring.

I prefer a practical approach to QA: understanding the system as a whole, quickly identifying root causes, and automating where it meaningfully reduces feedback time.
